

Daily Operation Tasks

This is probably the question that gets asked most.

What do you do everyday??

Well let's take a closer look at what we do operating a commercial aquaponics system.

Every morning is started the same

- Feed the fish
- Test the water parameters
- Look over fish for any sick ones
- Clean tanks if needed.
- Treat water if needed

From there we head over to our amazing greenhouse and get started on what we need to do daily there.

- Check nutrient levels
- Remove all suckers
- Pollinate flowers
- Water the seedlings
- Prune plants if needed
- Tie plants up if needed
- Look for pest in our plants
- Transplant seedlings.

This is our average day, on harvest days we will start to pick tomatoes at 5 am because its better to harvest early in the morning and spend about 4 hours hand packaging al of our produce before it is sent off to the market, that is every second day in summer.

It is important to do data input and connect with customers as well so you have to make time to catch up on all the admin work.

We use excel to do data input of all the tests and recordings we have made every day and also list any new things that might come up.

Currently once a week we slaughter fish as well. It is busy but you will find once you know what to do and have a great team to work with that things start to flow and you will even have time to do other tasks. We work 12 hour days every day so it is long days so make sure you are up for the challenge.
